

STRATEGIC TECHNOLOGY ACQUISITION & INVESTMENT BRIEF

MIMARIO

The Autonomous Revenue & Engineering Operating System

A local-first system unifying commercial opportunity discovery, qualification, proposal drafting, quarantined engineering execution, and auditable delivery.

4 Decoupled Engines · ~55,000 Verified LOC · Zero Mandatory Cloud Bills · Fail-Closed Gate 0 · Tamper-Evident SHA-256 Audit Trail.

Technical Status: 100% Operational in Runtime · 8 Certified Functional Blocks · 594 Clean Scanned Files · Release Candidate RC1

Why Existing AI Coding Assistants Fail the Economic Test

Software engineering needs full-cycle economic monetization and risk protection, not just mechanical autocomplete.

LIMITS OF PASSIVE ASSISTANTS	LIMITS OF CLOUD VM AGENTS	THE MIMARIO CATEGORY
Copilot, Cursor, Windsurf • Confined strictly to the text editor buffer. • Cannot discover paid opportunities or evaluate commercial feasibility. • Zero protection against unpaid, speculative scope creep. • Remain entirely dependent on human prompting for economic action.	Pure Cloud VM Agents • High compute overhead and infrastructure hosting costs (\$500+/mo/seat). • Exposes client IP and proprietary code to third-party hosted VMs. • Lacks structured commercial contracts from qualification to settlement. • Elevated risk of unsupervised hallucination without strict gate controls.	Autonomous Revenue OS • Unifies the full lifecycle: Radar -> Qualification -> Proposal -> Gate 0 -> Execution -> Delivery. • Local-First: runs locally on the host CPU with zero mandatory cloud fees. • Fail-Closed Gate 0: prohibits execution on third-party code without verified funding. • Retains human control at critical checkpoints (Human-in-the-Loop).

The 4 Decoupled Core Engines of MIMARIO

Modular, ultra-defensive architecture engineered for resilience, control, and auditability.

ENGINE 1 · COMMERCIAL	ENGINE 2 · ENGINEERING	ENGINE 3 · OPERATIONS	ENGINE 4 · SECURITY
Revenue Engine • Discovery Orchestrator (credential-free GitHub bounty radar). • Deterministic Fit & Scope Scorer. • 5-Tier Standardized Service Catalog (\$29 - \$750+). • C-Suite Executive Proposal Generator.	Engineering Engine • Isolated quarantine tree on local disk. • Static preflight verification without external network access. • Working copy tracking with automated change verification. • SHA-256 verified delivery packages and receipts.	Operations & Learning • Deterministic Learning Gate (blocks statistical models prior to 20 verified deliveries). • Continuous health, database, and freshness checks. • In-process periodic background scheduler. • Fail-closed operational anomaly alerts.	Local-Core & Store • SQLite in WAL mode with startup foreign key integrity verification. • Tamper-evident audit mechanism using SHA-256 event hash chain. • Strict 127.0.0.1 host loopback binding (zero open public ports). • Metadata-only wallet integration (zero private keys on disk).

Strategic Valuation Framework & Negotiation Benchmarks

Clear separation between technical reconstruction cost, strategic turn-key value, and scaling potential.

RECONSTRUCTION BENCHMARK \$450,000 — \$650,000 Basis: Estimated cost to duplicate the software asset from scratch. • ~55,000 verified TypeScript/Node.js LOC across 209 files. • 8 fully certified functional blocks (Blocks 0-7). • 9 frozen Genesis specifications verified via SHA-256. • Reference floor representing direct engineering labor savings for the acquirer.	STRATEGIC TURN-KEY TARGET \$1,200,000 — \$1,800,000 Basis: Strategic technology acquisition by a developer tooling vendor or engineering agency. • 100% operational and verifiable in live runtime. • Accelerates acquirer's product roadmap by 9 to 12 calendar months. • Adds direct opportunity-discovery and revenue capabilities to existing tooling.	HYPOTHETICAL SCALE POTENTIAL \$3,500,000 — \$5,000,000 Basis: Theoretical valuation derived from an enterprise B2B licensing scale model. • Standard market multiple (4x-6x) applied to an illustrative ARR of \$900k across hundreds of partner agencies. • Represents acquirer's commercial upside using existing distribution channels, not current ARR.
